直动式溢流补油阀

Direct-Acting, Relief anti-cavitation Valve

OPERATION

工作原理

Flow is free from ① to ② until pressure increases to meet the selected valve setting, allowing relief flow through port ① to tank. This valve combines the typical function of shock relief valve (direct acting) and anticavitation function through the check valve. The direct action and the specific design allow a very fast opening and closing. Note: to obtain a good leak proof performance coin the cavity seat using a loose valve seat as a coning tool.

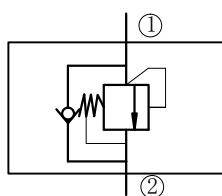

Torque to be applied : 4.5 ± 2 Nm.

液体从①口到②口自由流动，直到压力上升到符合所选阀的设置压力，允许通过①口溢流到油箱。结合溢流阀（直动）的典型功能和单向阀的补油功能。

直动式和特殊设计使阀芯快速打开和关闭。

注意：为了得到良好的防泄漏性能，使阀座结合活动阀芯作为一个密封副。要运用扭矩： 4.5 ± 2 Nm 调节，定值设置。
